

Netflix Data Exploratory Data Analysis (EDA)

Prepared By Ramsheena

Project Overview

This project performs Exploratory Data Analysis (EDA) on a comprehensive Netflix dataset containing video streaming records, content metadata, rating classification, and release details.

The goal is to analyze viewing patterns, clean missing structural data, perform statistical analysis, and generate actionable business insights using Python.

Project Objectives:

- Understand dataset structure and column feature
- Perform data cleaning and handle structural missing values
- Extract numerical values from complex mixed-unit strings
- Conduct univariate and bivariate analysis on media types
- Perform statistical testing on runtime and release gaps
- Analyze time-based addition and deployment trends
- Create custom engineered features for tracking international expansions
- Generate simple, high-level business insights

Tools & Libraries Used:

- Python
- Pandas
- NumPy
- Matplotlib
- Seaborn
- SciPy

- Git & GitHub

Dataset Information

- Source: Kaggle — Netflix Movies and TV Shows Dataset
- Size: 8,800+ rows × 12 columns
-

Dataset Features

- Numerical: release_year, duration_num, years_to_netflix
- Categorical: type, rating, country, director, listed_in
- Date Columns: date_added

Key Insights

- Content library is heavily biased towards standalone feature films
- Weekly uploads drop heavily and concentrate on Fridays
- The gap between original release year and streaming year is narrowing
- Mature and teen demographics dominate the overall rating segments
- International content expansion acts as a major driver for TV shows Most standard movies stick strictly around a 90 to 100-minute runtime
